

Common Banner Sizes (2026)

Quick reference for Marketing Art · 2026-09-17

Display / IAB fixed sizes still cover most programmatic and Google Display inventory. Social and responsive formats are ratio-based assets rather than one fixed pixel size. Use this when trimming a promo pack toward what operators actually buy.

1. Display / IAB — build these first

Size (px)	Name	Why it matters
300×250	Medium rectangle	#1 everywhere — desktop + mobile
728×90	Leaderboard	Desktop header / footer standard
320×50	Mobile banner	Default mobile web
300×600	Half page	High-viewability sidebar
160×600	Wide skyscraper	Desktop sidebar
320×100	Large mobile banner	Stronger mobile than 320×50
970×250	Billboard	Premium desktop
336×280	Large rectangle	Near-universal in-content

Lean starter set (max coverage / min production): **300×250, 728×90, 320×50, 300×600**

2. Social / Meta / Google responsive

These are ratio-based creatives, not classic IAB banners:

- **1:1 square** — 1080×1080 (safe universal across feed placements)
- **4:5 portrait** — 1080×1350 / 1440×1800 (mobile feed, more screen)
- **9:16 vertical** — 1080×1920 (Stories / Reels)
- **Google Responsive Display** — 1200×628 landscape + 1200×1200 square (+ portrait if available)

3. How to use this for pack trim

Keep client-required sizes and THE Series needs first. Prefer the lean IAB starter set for anything still optional. Remake cut sizes only when an operator asks through their account manager.
